A QUICK QUESTION

The drill already knows what’s inside

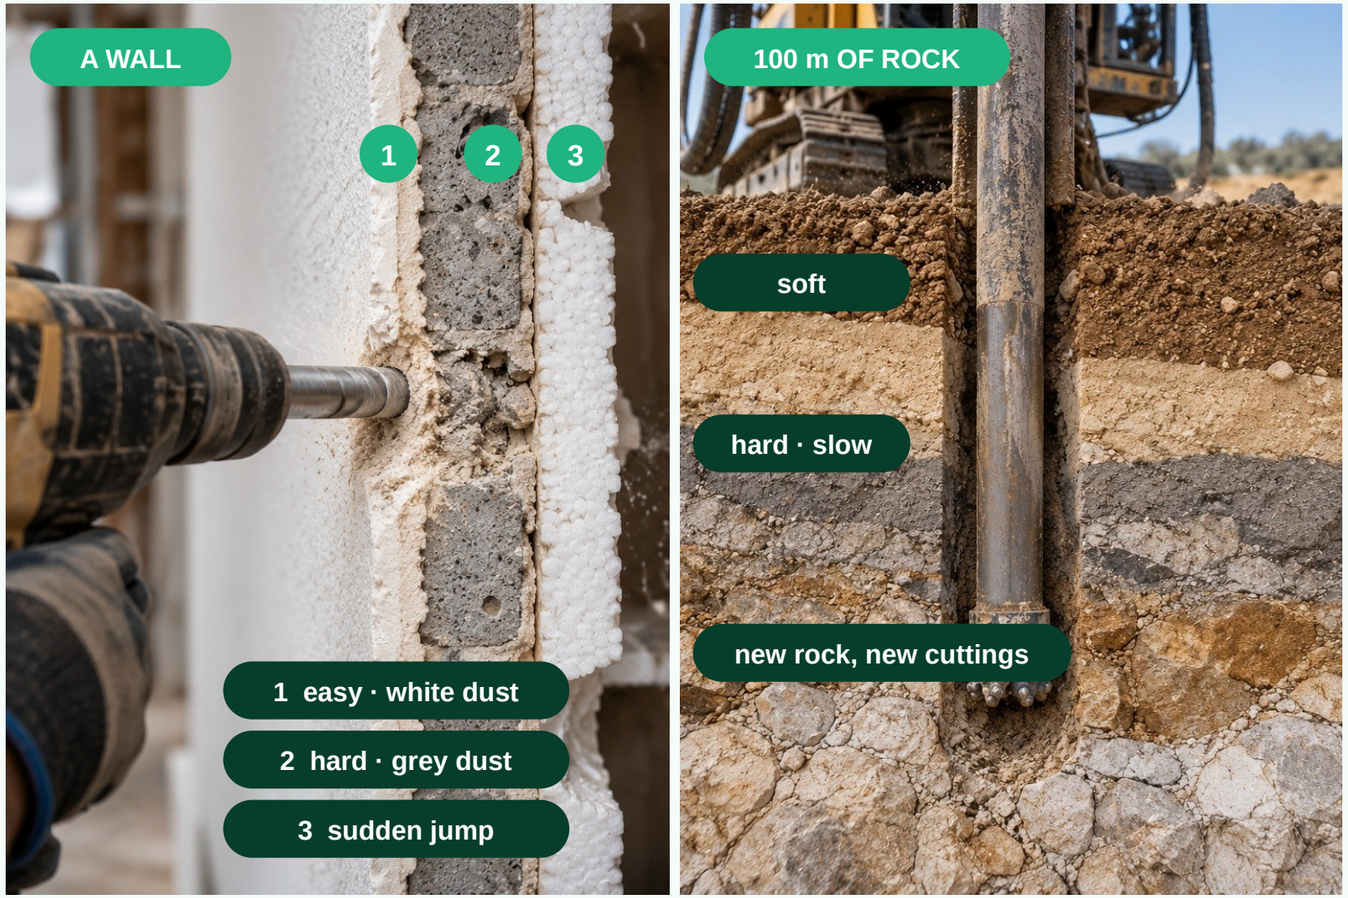

A mine drills 100 m of rock. How long until it knows what it hit?

- **A** A few hours
- **B** A few days
- **C** Weeks to months

Think of your answer…

A QUICK QUESTION

The drill already knows what’s inside

A mine drills 100 m of rock. How long until it knows what it hit?

- A — A few hours
- B — A few days
- C — **Weeks to months**

4–10[1]
weeks, typical wait for lab results

16 yrs[2]
from discovery to a working mine

Meanwhile, the rig felt every meter in real time.

1. Typical commercial lab assay turnaround; industry and company reports, 2021–2026. 2. S&P Global Market Intelligence, 2026: average discovery-to-production lead time (232 mines, 1990–2025).

Drillzy

THE INTELLIGENCE LAYER FOR CRITICAL MINERALS RESILIENCE

Turn every drilling rig into a real-time source of drilling & subsurface intelligence.

Every meter drilled becomes data, operational and geological.

1st place · Israel's Critical Minerals competition
Israel Innovation Authority & Ministry of Energy · 2026

Yair Gordin, Ph.D. · Founder & CEO

THE PROBLEM

Drilling is the first and only time we touch the rock

And that’s exactly where data stops.

A real drilling site: the record of the ground is a notebook and sample trays.

1

Best case: logged by hand

Subjective, and different with every person.

2

Often: no record at all

On many rigs, almost nothing the drill feels is ever captured.

3

Always: late, no standard

No common standard, and by the time it is a report, the decision on site has already been made.

THE SOLUTION

Make every meter drilled work twice.

Capture → Process → Deliver a vendor-agnostic sensing layer for any rig, old or new; physics + AI, tied to depth.

1 Here and now: at the rig

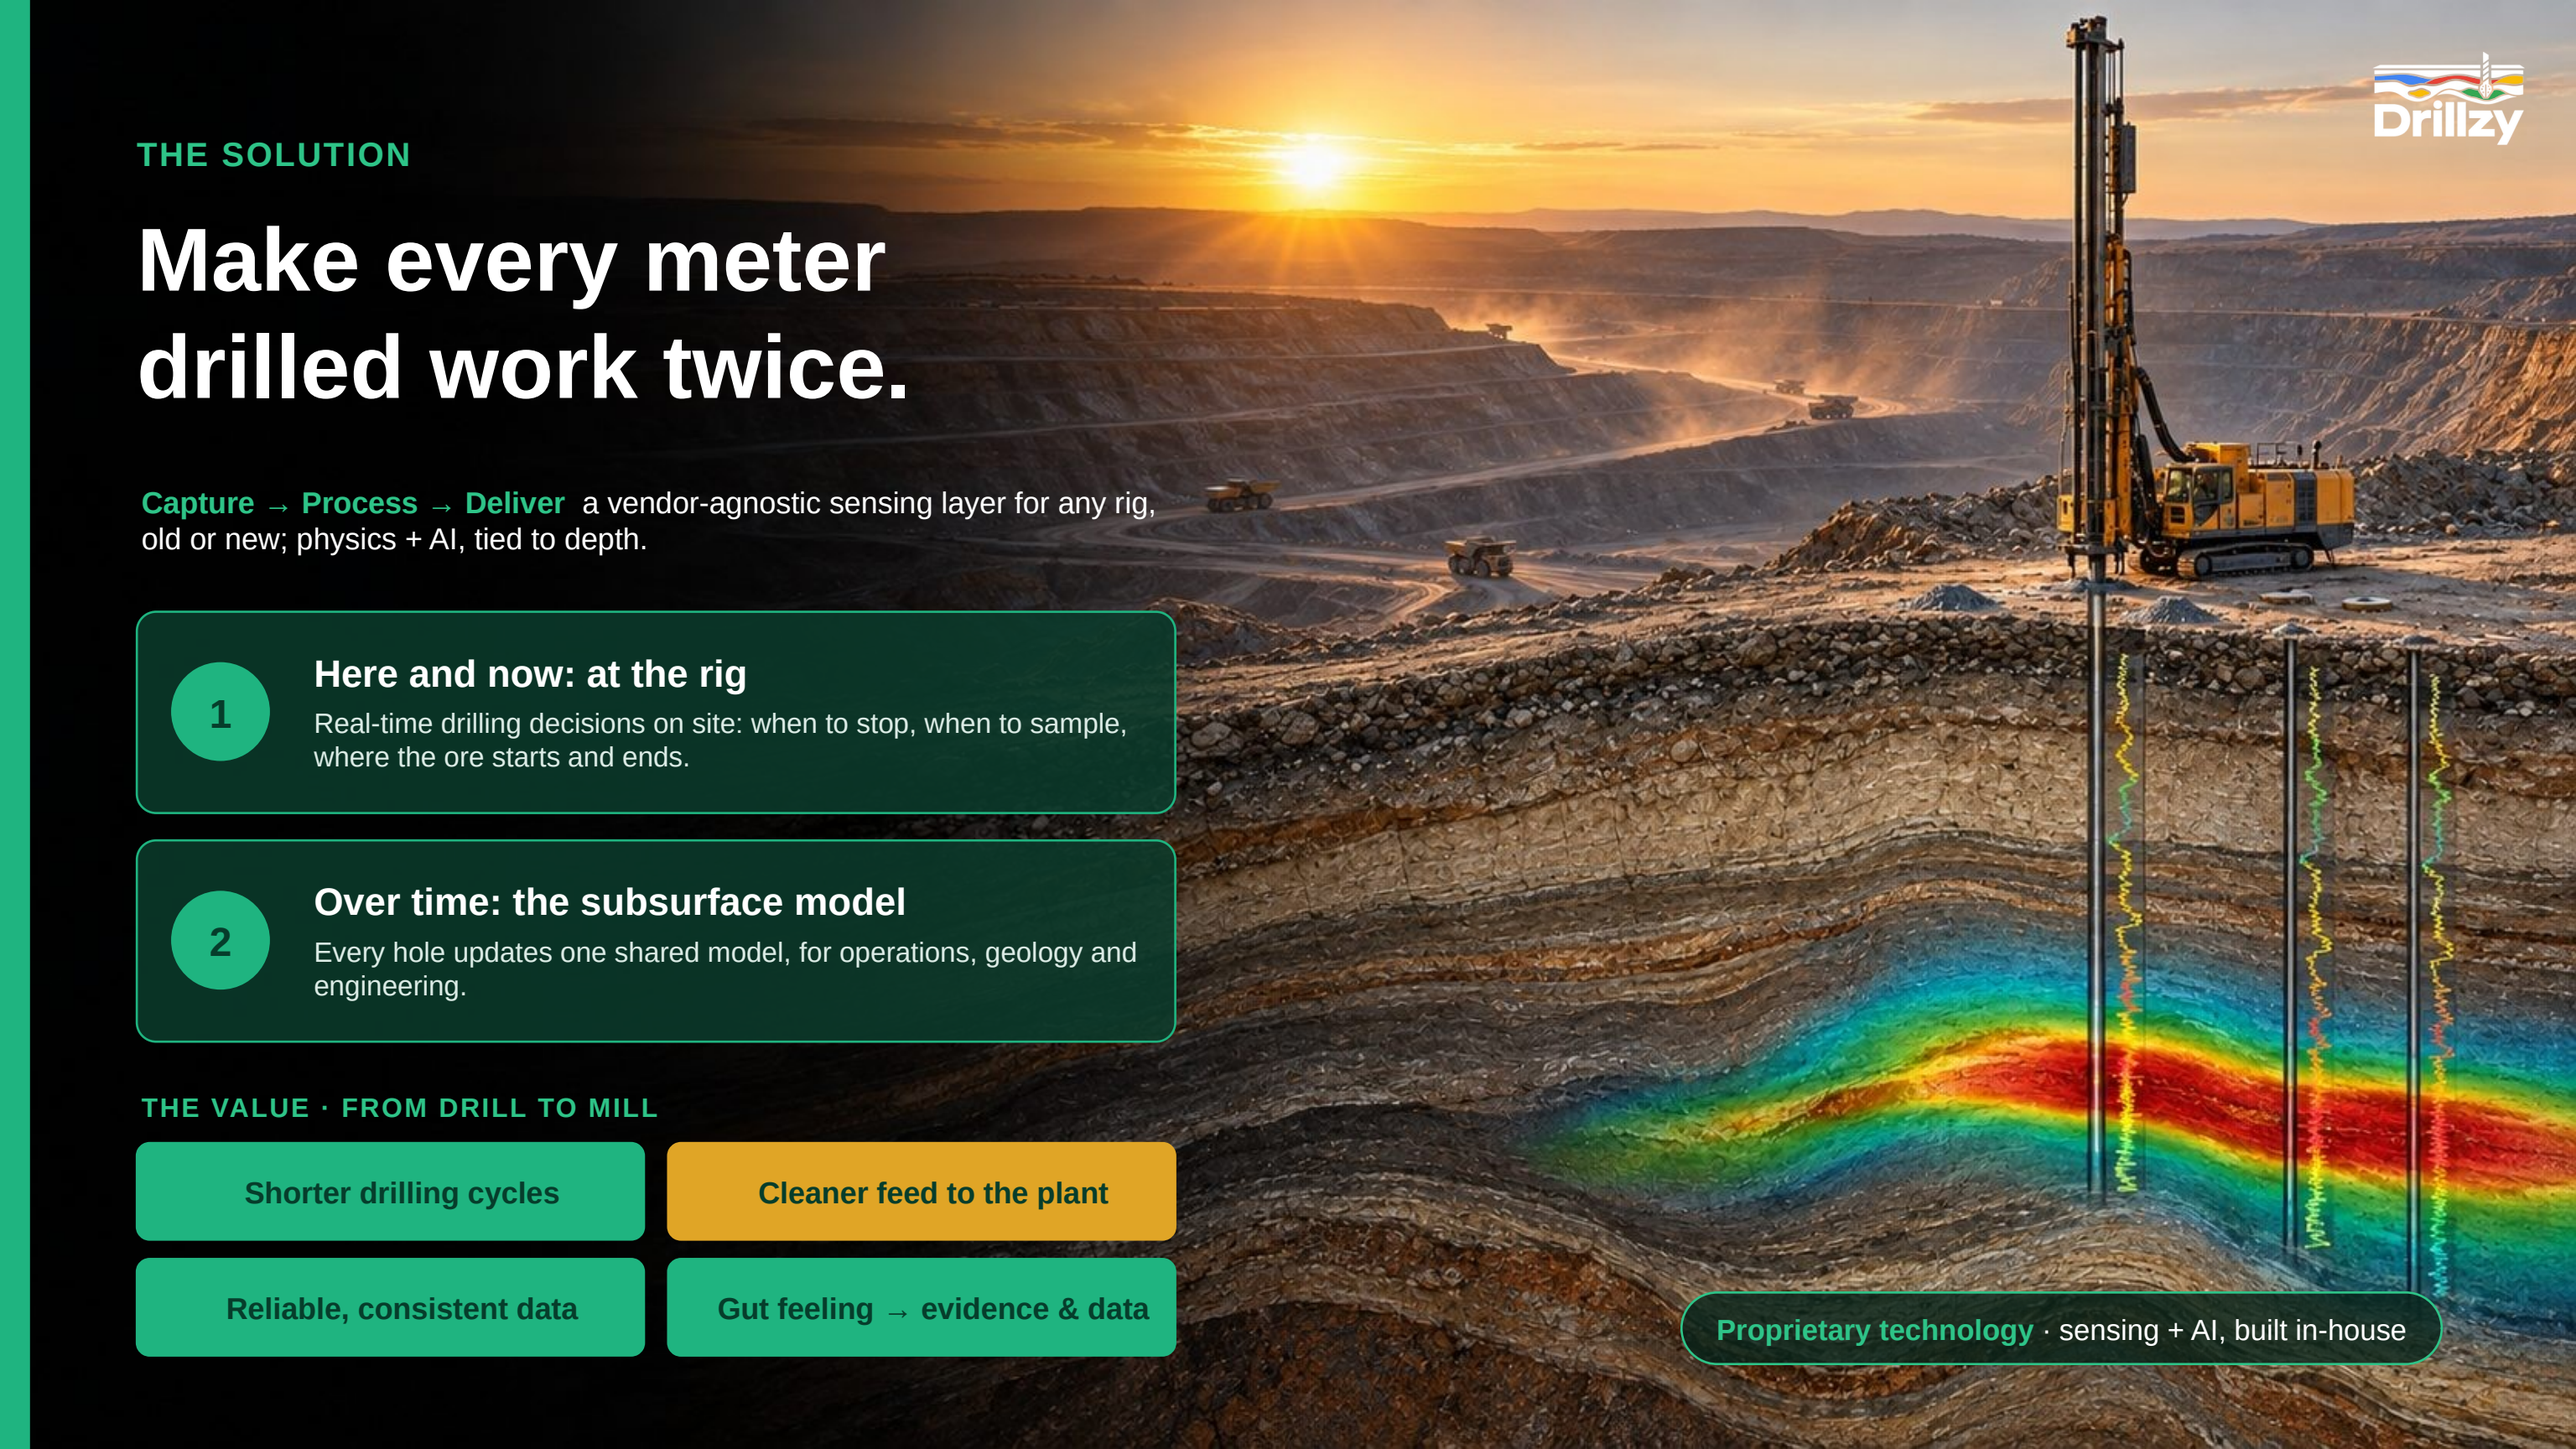

Real-time drilling decisions on site: when to stop, when to sample, where the ore starts and ends.

2 Over time: the subsurface model

Every hole updates one shared model, for operations, geology and engineering.

THE VALUE · FROM DRILL TO MILL

- Shorter drilling cycles
- Cleaner feed to the plant
- Reliable, consistent data
- Gut feeling → evidence & data

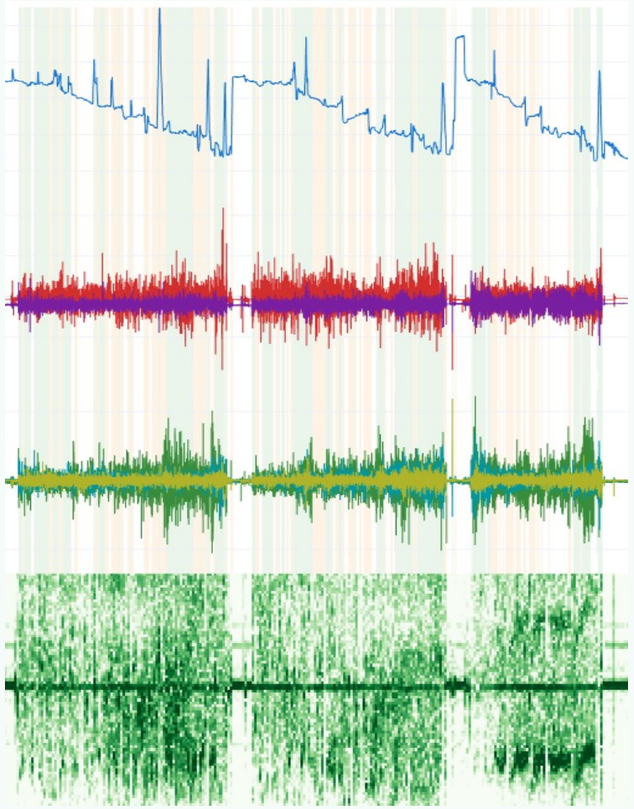

Proprietary technology · sensing + AI, built in-house

IN THE FIELD

Real rigs. Real drilling. Real data.

The Drillzy team on a working rig · open-pit mine

Real sensor data · time and depth · partial view

Dozens
boreholes, many deeper than 100 m

Dry & wet
drilling conditions, both measured

3
geologies that represent critical minerals

Any rig · vendor-agnostic

OUR DESIGN PARTNERS

Mining
Open-pit · sedimentary

Government body
Intrusive ore body · hard rock

Water utility
Aquifer drilling · brines

COMPETITIVE LANDSCAPE

Today you choose: rich data or scalable economics.

Richness of subsurface data ↑

Instruments & scans Rich data, high cost per hole	THE WHITE SPACE ★ **Drillzy** Rich data, on every hole, any rig
Manual logging Slow, subjective, inconsistent	**Software on existing data** Scales, but only reads what was already collected

Cost-effectiveness per meter →

A rare combination: four disciplines, one team.

Drillzy

Certainty underground.

Every meter drilled improves the next decision.

WHERE WE GO

TODAY

Open-pit mines

Exploration & blast-hole drilling

NEXT

Underground mining & tunneling

where ground risk costs most

THEN

Construction, foundations & underground infrastructure

~$10T / yr construction industry[1]

WE ARE LOOKING FOR

Pilot sites | **Strategic partners** | **Investors**
